

Unit 4.1 Context-Free Grammars

- Introduction to Context Free Grammar (CFG)
- Components of CFG
- Context Free Language (CFL)
- Derivation
- BNF Notation

Introduction

- ◆ Any language(Formal/Natural) has grammar to describe that language.
- ◆ A *context-free grammar* is a notation for describing formal languages.
- ◆ It is more powerful tool than finite automata or RE's, but still cannot define all possible languages.
- ◆ Useful for nested structures, e.g., parentheses in programming languages.

Introduction

- ◆ Basic idea is to use “variables” to stand for sets of strings (i.e., languages).
- ◆ These variables are defined recursively, in terms of one another.
- ◆ Recursive rules (“productions”) involve only concatenation.
- ◆ Alternative rules for a variable allow union.

Example: CFG for $\{ 0^n 1^n \mid n \geq 1 \}$

- ◆ Productions:

 - $S \rightarrow 01$

 - $S \rightarrow 0S1$

- ◆ Basis: 01 is in the language.

- ◆ Induction: if w is in the language, then so is $0w1$. (Recursive Rule)

Components of CFG

- ◆ *Terminals* = symbols of the alphabet of the language being defined.
- ◆ *Variables* = *nonterminals* = a finite set of other symbols, each of which represents a language construct.
- ◆ *Start symbol* = the variable whose language is the one being defined.

Components of CFG

- ◆ A *production* has the form
 - ◆ variable \rightarrow string of variables and terminals.
- ◆ Convention:
 - ◆ A, B, C,... are variables.
 - ◆ a, b, c,... are terminals.
 - ◆ ..., X, Y, Z are either terminals or variables.
 - ◆ ..., w, x, y, z are strings of terminals only.
 - ◆ $\alpha, \beta, \gamma, \dots$ are strings of terminals and/or variables.

Example: Formal CFG

- ◆ Here is a formal CFG for $\{ 0^n 1^n \mid n \geq 1 \}$.
- ◆ Terminals = $\{0, 1\}$.
- ◆ Variables = $\{S\}$.
- ◆ Start symbol = S .
- ◆ Productions =
 - $S \rightarrow 01$
 - $S \rightarrow 0S1$

Formal Definition of CFG

◆ A Context Free Grammar(CFG) is defined by 4-tuples as $G=(V,T,P,S)$ where

- ◆ V =Set of Variables
- ◆ T = Set of Terminals
- ◆ P =Set of Productions
- ◆ S = Start Variable, $S \in V$

Derivations – Intuition

- ◆ We *derive* strings in the language of a CFG by starting with the start symbol, and repeatedly replacing some variable A by the right side of one of its productions.
 - ◆ That is, the “productions for A ” are those that have A on the left side of the \rightarrow .

Derivations :Example

◆ We say $\alpha A \beta \Rightarrow \alpha \gamma \beta$ if $A \rightarrow \gamma$ is a production.

◆ **Example:** $S \rightarrow 01$; $S \rightarrow 0S1$.

◆ $S \Rightarrow 0S1 \Rightarrow 00S11 \Rightarrow 000111$.

Iterated Derivation

- ◆ \Rightarrow^* means "zero or more derivation steps."
- ◆ **Basis**: $\alpha \Rightarrow^* \alpha$ for any string α .
- ◆ **Induction**: if $\alpha \Rightarrow^* \beta$ and $\beta \Rightarrow \gamma$, then $\alpha \Rightarrow^* \gamma$.

Example: Iterated Derivation

◆ Let a CFG is:

◆ $S \rightarrow 01$

◆ $S \rightarrow 0S1.$

◆ $S \Rightarrow 0S1 \Rightarrow 00S11 \Rightarrow 000111.$

◆ So, $S \Rightarrow^* S;$ $S \Rightarrow^* 0S1;$
 $S \Rightarrow^* 00S11;$ $S \Rightarrow^* 000111.$

Sentential Forms

◆ Any string of variables and/or terminals derived from the start symbol is called a *sentential form*.

◆ Formally, α is a sentential form iff $S \Rightarrow^* \alpha$.

◆ In previous example,

$S \Rightarrow^* S; S \Rightarrow^* 0S1;$
 $S \Rightarrow^* 00S11; S \Rightarrow^* 000111.$

All are sentential forms

Language of a Grammar

◆ If G is a CFG, then $L(G)$, the *language of G* , is $\{w \mid S \Rightarrow^* w\}$.

◆ **Note:** w must be a terminal string, S is the start symbol.

◆ **Example:** G has productions $S \rightarrow \epsilon$ and $S \rightarrow 0S1$.

◆ $L(G) = \{0^n 1^n \mid n \geq 0\}$.

Note: ϵ is a legitimate right side.

Context-Free Languages

- ◆ A language that is defined by some CFG is called a *context-free language*.
- ◆ There are CFL's that are not regular languages, such as the example just given above and we have proved that the language is not regular using pumping lemma.
- ◆ But not all languages are CFL's.
- ◆ The programming languages are CFL since they are described by CFG

Top-down and Bottom-up Derivations

- ◆ **Top-down:** Derivations of string starting from start variable and by replacing variable at each step to reach up to the string.
- ◆ **Bottom-up:** Derivation process starting from a string and reducing the substrings by a variable applying any production to get start variable.

Example: Top-down Derivations

- ◆ Grammar for Strings of Balanced-parentheses

$S \rightarrow SS \mid (S) \mid ()$

- ◆ $S \Rightarrow SS$

$\Rightarrow S()$

$\Rightarrow (S)()$

$\Rightarrow (())()$ is from top-down derivation

Example: Bottom-up Derivations

◆ Grammar for Strings of Balanced-parentheses

$S \rightarrow SS \mid (S) \mid ()$

Bottom-up derivation for string: $((()))()$

String	Variable	Production	String used
$()$	S	$S \rightarrow ()$	-
$((()))$	S	$S \rightarrow (S)$	$()$
$((()))()$	S	$S \rightarrow SS$	$((()))$ and $()$

Hence we got from bottom up from string to start variable as:

Leftmost and Rightmost Derivations

- ◆ Derivations allow us to replace any of the variables in a string.
- ◆ Leads to many different derivations of the same string.
- ◆ By forcing the leftmost variable (or alternatively, the rightmost variable) to be replaced, the derivation can be Leftmost or rightmost.

Leftmost Derivations

- ◆ Say $wA\alpha \Rightarrow_{lm} w\beta\alpha$ if w is a string of terminals only and $A \rightarrow \beta$ is a production.
- ◆ Also, $\alpha \Rightarrow_{lm}^* \beta$ if α becomes β by a sequence of 0 or more \Rightarrow_{lm} steps.

Example: Leftmost Derivations

- ◆ Balanced-parentheses grammar:

$$S \rightarrow SS \mid (S) \mid ()$$

- ◆ $S \Rightarrow_{lm} SS \Rightarrow_{lm} (S)S \Rightarrow_{lm} (()S \Rightarrow_{lm} (()())$

- ◆ Thus, $S \Rightarrow_{lm}^* (()())$

- ◆ $S \Rightarrow SS \Rightarrow S() \Rightarrow (S)() \Rightarrow (()())$ is a derivation, but not a leftmost derivation.

Rightmost Derivations

- ◆ Say $\alpha Aw \Rightarrow_{rm} \alpha \beta w$ if w is a string of terminals only and $A \rightarrow \beta$ is a production.
- ◆ Also, $\alpha \Rightarrow_{rm}^* \beta$ if α becomes β by a sequence of 0 or more \Rightarrow_{rm} steps.

Example: Rightmost Derivations

- ◆ Balanced-parentheses grammar:

$$S \rightarrow SS \mid (S) \mid ()$$

- ◆ $S \Rightarrow_{\text{rm}} SS \Rightarrow_{\text{rm}} S() \Rightarrow_{\text{rm}} (S)() \Rightarrow_{\text{rm}} (())()$

- ◆ Thus, $S \Rightarrow_{\text{rm}}^* (())()$

- ◆ $S \Rightarrow SS \Rightarrow SSS \Rightarrow S()S \Rightarrow ()()S \Rightarrow ()()()$
is neither a rightmost nor a leftmost derivation.

Example : Leftmost Derivation

◆ Given a grammar:

◆ $E \rightarrow E+E, E \rightarrow E * E, E \rightarrow (E), E \rightarrow E-E, E \rightarrow a, E \rightarrow b$

◆ Derivation for String **$a^*(a+b)-a$**

◆ $E \Rightarrow_{lm} E-E$
 $\Rightarrow_{lm} E * E-E$
 $\Rightarrow_{lm} a * E-E$
 $\Rightarrow_{lm} a * (E)-E$
 $\Rightarrow_{lm} a * (E+E)-E$
 $\Rightarrow_{lm} a * (a+E)-E$
 $\Rightarrow_{lm} a * (a+b)-E$
 $\Rightarrow_{lm} a^*(a+b)-a$

Example : Rightmost Derivation

◆ Given a grammar:

◆ $E \rightarrow E+E, E \rightarrow E * E, E \rightarrow (E), E \rightarrow a, E \rightarrow E-E, E \rightarrow b$

◆ Derivation for String $a^*(a+b)-a$

◆ $E \Rightarrow_{rm} E-E$
 $\Rightarrow_{rm} E-a$
 $\Rightarrow_{rm} E * E-a$
 $\Rightarrow_{rm} E * (E)-a$
 $\Rightarrow_{rm} E * (E+E)-a$
 $\Rightarrow_{rm} E * (E+b)-a$
 $\Rightarrow_{rm} E * (a+b)-a$
 $\Rightarrow_{rm} a * (a+b)-a$

BNF Notation

- ◆ Grammars for programming languages are often written in BNF (*Backus-Naur Form*).
- ◆ Variables are words in <...>;
 - ◆ Example: <statement>.
- ◆ Terminals are often multi-character strings indicated by boldface or underline;
 - ◆ Example: **while** or WHILE.

BNF Notation

- ◆ Symbol $::=$ is often used for \rightarrow .
- ◆ Symbol $|$ is used for “or.”
 - ◆ A shorthand for a list of productions with the same left side.
- ◆ **Example:** $S \rightarrow 0S1 \mid 01$ is shorthand for **$S \rightarrow 0S1$ and $S \rightarrow 01$.**

BNF Notation – Kleene Closure

- ◆ Symbol \dots is used for “one or more.”
 - ◆ Example: $\langle \text{digit} \rangle ::= 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9$
 $\langle \text{unsigned integer} \rangle ::= \langle \text{digit} \rangle \dots$
- ◆ Translation: Replace $\alpha \dots$ with a new variable A and productions $A \rightarrow A\alpha \mid \alpha$.

Example: Kleene Closure

- ◆ Grammar for unsigned integers can be replaced by:

U -> UD | D

D -> 0|1|2|3|4|5|6|7|8|9

In BNF:

**<unsigned integer> ::= <unsigned integer><digit>
| <digit>**

<digit> ::= 0|1|2|3|4|5|6|7|8|9

BNF Notation: Optional Elements

- ◆ Surround one or more symbols by [...] to make them optional.
- ◆ **Example:** $\langle \text{statement} \rangle ::= \text{if } \langle \text{condition} \rangle \text{ then } \langle \text{statement} \rangle [; \text{else } \langle \text{statement} \rangle]$
- ◆ **Translation:** replace $[\alpha]$ by a new variable A with productions $A \rightarrow \alpha \mid \epsilon$.

Example: Optional Elements

- ◆ Grammar for if-then-else can be replaced by:

$S \rightarrow iCtSA$

$A \rightarrow ;eS \mid \epsilon$

BNF Notation – Grouping

- ◆ Use {...} to surround a sequence of symbols that need to be treated as a unit.
 - ◆ Typically, they are followed by a ... for “one or more.”
- ◆ **Example:** <statement list> ::= <statement> [{; <statement>}...]

Translation: Grouping

- ◆ You may, if you wish, create a new variable A for $\{\alpha\}$.
- ◆ One production for A : $A \rightarrow \alpha$.
- ◆ Use A in place of $\{\alpha\}$.

Example: Grouping

$L \rightarrow S \{ ;S \} \dots$

- ◆ Replace by $L \rightarrow S [A \dots]$ $A \rightarrow ;S$
 - ◆ A stands for $\{ ;S \}$.
- ◆ Then by $L \rightarrow SB$ $B \rightarrow A \dots \mid \epsilon$ $A \rightarrow ;S$
 - ◆ B stands for $[A \dots]$ (zero or more A's).
- ◆ Finally by $L \rightarrow SB$ $B \rightarrow C \mid \epsilon$
 $C \rightarrow AC \mid A$ $A \rightarrow ;S$
 - ◆ C stands for $A \dots$.
