

ACKNOWLEDGEMENT

I, along with my project team members, would like to extend sincere gratitude to everyone who supported and guided us in successfully completing our System Analysis and Design project. First and foremost, we express deep appreciation to **Mr. Hikmat Rokaya**, our respected supervisor and mentor, for his invaluable guidance, insightful feedback, and constant encouragement throughout the project. We also acknowledge the helpful online resources and materials he provided, which greatly assisted us in reviewing and refining our work.

We are also thankful to the **Department of Computer Science and Information Technology** at **Patan Multiple Campus** for providing the necessary resources and an enabling academic environment for our research and development.

Our thanks also go to our classmates and colleagues for their constructive suggestions and cooperation. Special gratitude is owed to our families for their patience, motivation, and unwavering support during the project duration.

Lastly, we acknowledge the dedicated efforts and teamwork of every member in our group, whose collaboration made this endeavor a valuable learning experience.

CERTIFICATE

This is to certify that the project report entitled “**Hospital Management System**” has been prepared by students of the **B.Sc. CSIT program** at **Patan Multiple Campus, Tribhuvan University**, under the supervision of Mr. Hikmat Rokaya, Assistant Professor, Department of Computer Science and Information Technology. This report is based on referenced materials and online resources provided by the supervisor, including websites such as GeekforGeeks, and to represent as the lab report.

ABSTRACT

The Hospital Management System (HMS) is a comprehensive software designed to optimize the administrative, clinical, and financial processes of a hospital.

This project aims to improve operational efficiency by automating key functions such as patient registration, appointment scheduling, doctor assignments, medical record management, billing, and inventory control.

By facilitating seamless communication between departments and providing real-time access to patient information, the system enhances service quality and reduces manual errors. Its features include user authentication, role-based access for administrators, doctors, nurses, and receptionists, a centralized patient database, and report generation tools.

Developed using programming languages including C and PHP, and supported by detailed UML diagrams and data flow diagrams, the system emphasizes scalability, security, and user-friendliness.

This project exemplifies the practical application of system analysis and design methodologies, addressing challenges in traditional hospital workflows and contributing to the healthcare sector's digital transformation.
